## SMART SYSTEM: ARMATIX IS PRESENTING THE FUTURE OF THE WEAPON. NOW.

Unterföhring, May 2011

---

An intelligent pistol: Which shooter is authorized for what sort of actions, how many shots have been fired in what timeframe, when was the last time the weapon has been secured and released, is a shot permitted in the direction of a target the gun sights currently are....? What still sounds to be still a long way off is already reality at Armatix. With Smart System, intelligent electronics finally has found its way into the world of handguns.

Smart System consists of an active RFID watch that is responsible for gun access and use. Microchips in the watch and in the gun communicate with each other. A smart system will only shoot if it is within the range of this watch. It is possible to release the safety mechanism via the active RFID watch activated by means of a PIN code. As soon as the gun loses radio contact with the watch – e.g. if it is knocked out of the shooter's hand or in case of loss, theft etc. – it automatically deactivates itself. Smart System can be linked computer technology enabling a complete tracking and monitoring of the gun. Using the optional Target Control module the weapon will only function if the gun's sights are on the "permitted" target.

Armatix is currently involved in advanced licensing negotiations with several gun manufacturers. In addition, Armatix offers a tried and tested smart system in the form of a development of its own: the iP1 pistol (.22 LR caliber) and the iW1 active RFID watch. This technology carrier from Armatix is proof that guns with integrated electronic intelligence are already possible and feasible today.

*Armatix shifts the issue of gun safety to the 21st century. The company, headquartered in Unterföhring near Munich, combines the know-how of SimonsVoss, being the European market leader in the sector of electronic lock systems with the experience of using these systems for securing handguns.*
