
BASELOCK: ARMATIX PRESENTS NEW MULTI-GUN SAFETY STORAGE DEVICE.

Unterföhring May 2011

Armatix Baselock is a complete and highly innovative safety solution for small and large stock of arms. The intelligent stationary system is securing all types of short guns – including their magazines – and connects them to centralized monitoring processes upon request. This opens up completely new dimensions for the user with regard to management as well as monitoring and tracking individual guns or entire stock of arms.

Baselock modules can be combined in any way and mounted in any way required. The holders can be mounted on a table, wall or floor in buildings, cars or special purpose vehicles of all kinds. Baselock modules can be used in any number and combination with one another; every gun is secured individually. Individual removal is only possible after entry of a unique PIN code or via fingerprint or contact-less transponder activation. The entire stock of arms can be removed following centralized or decentralized release using a group code.

The respective pistol or revolver is placed on an Armatix blocking device integrated in a Baselock module and locked by applying slight pressure. By this procedure barrel and chamber will be locked automatically. For release just enter personal PIN code or use fingerprint. After that the respective gun can be removed within seconds. The mechatronic locking device also belongs to one of several patent families of Armatix.

With an Armatix blocking device in the cartridge chamber, the gun is more effectively protected against misuse than in the gun cabinet. Unauthorized violent removal of the Armatix locking element irreparably destroys the gun

Using Baselock type of safety mechanism, weapons can be stored or transported together with ammunition – it is impossible to load a cartridge in this secure state!

Armatix shifts the issue of gun safety to the 21st century. The company, headquartered in Unterföhring near Munich, combines the know-how of SimonsVoss, being the European market leader in the sector of electronic lock systems with the experience of using these systems for securing handguns.
